

QUICK-BUILD KIT

Noble Home's new Quick-Build house building kit is a streamlined version of our original kit design. With fewer components and connections, building this model can be faster and less costly. The kit and associated design costs start at \$55 per square foot.

This modern design is also conducive to passive solar heating, with large fixed glass panels and optional water storage bottles for additional heat storage capacity. The roof overhang protects the structure from the summer sun, keeping the space cool during the hot months. The continuous highly insulated shell consisting of Thermasteel® EPS structural panels (R35) help maintain a comfortable and weather tight building envelope as well as low energy costs.

Structural clerestory windows, providing even natural lighting, is incorporated into this model which supports the roof, so there is no need for the timber trusses of the original Noble Home kit. Additionally, a series of wood interior ridge support units help divide the space while adding storage and providing a structural and aesthetic richness to the space. Additional storage and/or seating options can be fixed to these units in more compact homes.

This sample floor plan illustrates a 1040 square feet (20' x 52'), 1 bedroom plan with generous living spaces. Any size from 240 square feet on up can be built. Every plan is custom designed to meet your spatial and building site requirements. All construction plans are engineer certified and

ready to submit to your building department.

The QUICK-BUILD kit can be easily assembled by competent owner-builders in a fraction of the time it takes to site build a home of equal performance. All components are easily carried and placed by one or two people, reducing the need for mechanical equipment during assembly.

The home can be designed on a concrete slab-on-grade as a finished floor for maximum thermal mass, or on a framed floor on piers for construction cost savings.

Testimonials

NOBLE HOME KIT, TENNESSEE

House is great. Energy bills unbelievably low. I underestimated how effective the cool of the slab was in summer and even now in July I haven't put an AC in. The reflective roof and big eaves are a real benefit in this climate as well.

-Joe

NOBLE HOME KIT, OHIO

Noble Home has enabled us to build a house that is not only beautiful, but greener than we would have been able to afford.

-The Bregelmans
